CONTROLS
Warning Symbol

This Symbol calls attention to an operating procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury or damage to or destruction of part or all of the product and system. Do not proceed beyond a warning symbol until the indicated conditions are fully understood and met.

Use the Manual

• Installers Read Chapter 1, 2
• System Designer Read All Chapters
• User Read Chapters 3, 4

NOTE:

It is strongly recommended that an independent LIMIT CONTROL like the FDC L91 be incorporated into the process to shut down the equipment at a preset process condition in order to prevent possible damage to product and/or the system.

Information in this user's manual is subject to change without notice.

Chapter 1 Overview

1-1 General
The Fuzzy Logic plus PID microprocessor-based profiling controller series, incorporate two bright, easy to read 4-digit LED displays indicating process value and set point value. The Fuzzy Logic technology enables a process to reach a predetermined set point in the shortest time, with minimum overshoot during power-up or external load disturbance.

The P91 is a 1/16 DIN size panel mount profiling controller. It can also be used for rail mount by adding a rail mount kit. The P41 is a 1/4 DIN size panel mount profiling controller. These units are powered by standard 90-250Vac or optional 11-26Vdc supply, incorporating a 2 amp. control relay output as standard. The second output can be used as a cooling control output, an event output or an alarm. Both outputs can support triac, logic output, linear current or linear voltage.

Both units are fully programmable for PT100 and thermocouple types J, K, T, E, B, R, S, N, L, C, P as standard. MA and VDC inputs are optional and must be specified at time of order. The fast input sampling rate and high accuracy 18-bit A to D converter, allow these units to respond quickly in order to control fast processes.

The controller outputs can also be configured as more than just basic heating and/or cooling outputs, these include: up to three alarm outputs, up to three event outputs and up to two analog retransmission outputs.

Digital communications, RS-485 or RS-232, are available as an additional option. These options allow the units to be integrated with a supervisory control system and software.

A programming port is available for automatic configuration without the need to access the keys on the front panel.

By using proprietary Fuzzy modified PID technology, the control loop will minimize overshoot and undershoot of the process in the shortest time possible. The following diagram is a comparison of results with and without Fuzzy technology.
The "P" series can be configured as a single set point controller (static mode) or a ramp and dwell profiling controller (profile mode). The profile mode feature allows the user to program up to 9 profiles of up to 64 free-format (ramp, dwell, jump or end) segments each. The total segments available for the product is 288 segments. NOTE: Profiles can NOT be linked together.

The profiling controllers contain the following features:

**Flexible Program Configuration**

Up to 64 segments can be programmed for a single profile. Each segment can be configured as a ramp or a dwell (soak) segment, or a jump step defining a repeat number of cycles within the profile and finally terminated by an end segment. During operation, the user can edit segments of the running profile to make in process changes.

**Maximum Program Capacity**

There are a total of 9 profiles can be defined. Profiles are divided into three different lengths: profiles 1-4 can be a maximum of 16 segments, profiles 5-7 can be a maximum of 32 segments and profiles 7-9 are 64 segments maximum. All profiles begin with segment 0, i.e., profile 1 allows for programming of segments 0-15 (for a total of 16 segments) while profile 7 allows programming of segments 0-63 (64 total).

**Event Input**

The event input feature allows the user to select one of eight functions: enter profile run mode, enter profile hold mode, abort profile mode, enter manual mode, perform failure transfer, enter off mode, advance to the next segment and select second set of PID values.
Programmable Event Outputs
Up to three relays are configurable for event outputs and the state of each output can be defined for each segment and end of profile.

Analog Retransmission
Output 5 and output 4 (P41 only) of the products can be equipped with an analog output module. The output can be configured for transmitting the process value as well as set point value.

High Accuracy
The “P” series are manufactured with custom designed ASIC (Application Specific Integrated Circuit) technology which contains an 18-bit A to D converter for high resolution measurement (true 0.1 F resolution for thermocouple and PT100) and a 15-bit D to A converter for linear current or voltage control outputs. The ASIC technology provides improved operating performance, low cost, enhanced reliability and higher density.

Fast Sampling Rate
The sampling rate of the input A to D converter is 5 time/second (5Hz). The fast sampling rate allows the “P” series to control fast processes.

Fuzzy Control
The function of fuzzy control is to fine tune and adjust PID parameters based on the previous response of the process to the controller output and allow the controller to adapt to various processes. The result is to enable the process to reach a predetermined set point in the shortest time, with minimum overshoot and undershoot during power-up or external load disturbance.

Digital Communication
The units can be equipped with an RS-485 or RS-232 interface card to provide digital communications. When using the RS-485 interface, up to 247 units can be connected together to a host computer.

Programming Port
A programming port is used to connect the unit to a PC for quick configuration.
See Related Products Pg 10
Auto-tune
The auto-tune function allows the user to simplify initial setup for a new system. The internal algorithm is provided to obtain an optimal set of control parameters for the process which can be applied when the process is warming up (cold start) or after the process has been operating at steady state (warm start) conditions.

Lockout Protection
A password can be entered to prevent parameters from being changed. If a password is activated, the password must successfully be set to allow any changes to the unit.

Bumpless Transfer
Bumpless transfer allows the controller to continue to control by using its previous output value if the sensor breaks. As a result, the process can maintain control temporarily as if the sensor was operating normally.

Digital Filter
A first order low pass filter with a programmable time constant is used to improve the stability of the process value. This is particularly useful in certain applications where the process value fluctuates rapidly.

SEL Function
The units provide the ability for user to select parameters which are more important and place these parameters in the home page for quick access. There are 8 parameters to choose from which allow the user to build their own custom display sequence.
1-2 Ordering Code

**Power Input**
- 4: 90 - 250 VAC, 47-63 Hz
- 5: 11 - 26 VAC or VDC, SELV, Limited Energy

**Signal Input**
1: Standard Input
   - RTD: PT100 DIN, PT100 JIS
   - Voltage: 0-60mV
- 5: 0-10V, 0-1V, 0-5V, 1-5V *
- 6: 0-20/4-20mA *
- 9: Special Order

**Output 1**
- 0: None
- 1: Relay rated 2A/240VAC
- 2: SSR Driver 5 VDC @ 30 Ma
- 3: 4 - 20mA / 0 - 20mA Isolated
- 4: 1 - 5V / 0 - 5V/0 - 10V Isolated
- 6: Triac output 1A / 240VAC, SSR
- C: SSR Driver 14 VDC @ 40 Ma
- 9: Special Order

**Output 2**
- 0: None
- 1: Relay rated 2A/240VAC
- 2: SSR Driver 5 VDC @ 30 ma
- 3: 4 - 20mA / 0 - 20mA Isolated
- 4: 1 - 5V / 0 - 5V/0 - 10V Isolated
- 6: Triac output 1A / 240VAC, SSR
- 7: Trans power supply 20 VDC/25 ma Isolated
- 8: Trans power supply 12 VDC/40 Ma Isolated
- A: Trans power supply 5 VDC/80 Ma Isolated
- C: SSR Driver 14 VDC @ 40 Ma
- 9: Special Order

**Output 3**
- 0: None
- 1: Relay rated 2A/240VAC
- 2: SSR Driver 5 VDC @ 30 Ma
- 6: Triac output 1A / 240VAC, SSR
- 7: Trans power supply 20 VDC/25 ma Isolated
- 8: Trans power supply 12 VDC/40 ma Isolated
- A: Trans power supply 5 VDC/80 ma Isolated
- C: SSR Driver 14 VDC @ 40 Ma
- 9: Special order

**Output 4 (P41 ONLY)**
- 0: None
- 1: Relay rated 2A/240VAC
- 2: SSR Driver 5 VDC @ 30 Ma
- 3: 4 - 20mA / 0 - 20mA Retrans Isolated
- 4: 1 - 5V / 0 - 5V/0 - 10V Retrans Isolated
- 6: Triac output 1A / 240VAC, SSR
- 7: Trans power supply 20 VDC/25 Ma Isolated
- 8: Trans power supply 12 VDC/40Ma Isolated
- A: Trans power supply 5 VDC/80 Ma Isolated
- C: SSR Driver 14 VDC @ 40 Ma
- 9: Special order

**Output 5**
- 0: None
- 3: 4 - 20mA / 0 - 20mA Retrans Isolated
- 4: 1 - 5V / 0 - 5V/0 - 10V Retrans Isolated
- 7: Trans power supply 20 VDC/25ma Isolated
- 8: Trans power supply 12 VDC/40 Ma Isolated
- A: Trans power supply 5 VDC/80 Ma Isolated
- D: RS-485 Interface Isolated
- E: RS-232 Interface Isolated

**Options**
- 0: Panel mount IP50 standard
- 1: Panel mount IP65 water resistant rubber installed
- 2: DIN rail mount with IP50 (for P91 only)
- 3: DIN rail mount with IP65 (for P91 only)

*NOTE: Reference ONLY Input solder bridges select type of input allowed. These are set as ordered from factory.
Input option 1 = T/C, RTD, MV G1-shorted, G2-Open
Input option 5 = VDC-G1-opened, G2-Open
Input option 6 = Ma - G1 Don’t Care, G2-Short
If an input field change is required CONSULT FACTORY.
**Accessories**

**Related Products**

SNA-10A - This is an RS232/RS485 converter used for 3rd party software supporting multi-loop RS-485 serial communications.

SNA-12A This is an RS232/RS485 converter used with the FDC-Set Configuration software.
P/n CC91-1 This is a Configuration cable and must also be used with SNA-12A when using FDC-Set.
A special connector (CC91-1) is used to connect the programming port to a PC for automatic configuration. The PC must have FDC-Set installed to use the configuration feature via PC.

The programming port is used for **off-line** automatic setup and testing procedures only. Do **NOT** attempt to make any connection to these pins when the unit is “On-Line” in a running application.

See page 10 for parts needed for using configurator port.
1- 4 Keys and Displays

KEYPAD OPERATION

SCROLL KEY : ◀
This key is used to select a parameter to be viewed or adjusted.

UP KEY : ▲
This key is used to increase the value of selected parameter.

DOWN KEY : ◀
This key is used to decrease the value of selected parameter.

PAGE KEY: ◁
This key is used to select desired page of parameters.

REVERSE SCROLL : ◀ ▲
Press both ◀ and ▲ keys to jump to the previous parameter.

RESET KEY : ▲ ◀
Press both ▲ and ◀ keys to:
1. Revert the display to display the process value.
2. Reset the latching alarm, once the alarm condition is removed.
3. Stop the manual control mode, auto-tuning mode and off mode, then enters the static mode.
4. Clear the message of communication error, holdback time out error and auto-tuning error.

ENTER KEY : Press ◁ for 5 seconds to:
1. Enter the selected mode to run.
2. Enter the CONF settings
3. Execute calibration procedure for the low point and high point calibration.
Output Status indicators for output1~output 4

- Upper Display, to display process value, menu symbol and error code etc.
- Lower Display, to display set point value, parameter value or control output value etc.

- On : profile running
- Flashing: profile in delayed state

- On : profile held
- Flashing: profile in holdback state

- ▲ : Running ramp up segment
- ▼ : Running ramp down segment
- ▲▼ : Running dwell segment

Both off : profile held or in static mode
Both Flashing: profile completed

4 Buttons for ease of control setup and set point adjustment.

Upper Display, to display process value, menu symbol and error code etc.
Lower Display, to display set point value, parameter value or control output value etc.

- ▲ : Running ramp up segment
- ▼ : Running ramp down segment
- ▲▼ : Running dwell segment

Both off : profile held or in static mode
Both Flashing: profile completed

4 Buttons for ease of control setup and set point adjustment.

Figure 1.3 Front Panel Description
The unit will display the program code for 2.5 seconds during power up. The code is the program number followed by the version number. For the P41, the program number is 37. The program number for the P91 is 38. In the example figure below, the version number is 12.

15
Using or key to adjust the offset low value (lower display) until the process value (higher display) is equal to the required value, then

Complete calibration procedure for the low point calibration.

Using or key to adjust the offset high value (lower display) until the process value (higher display) is equal to the required value, then

Complete calibration procedure for the high point calibration.

Once the unit has been configured under a specific decimal point selection, changing the decimal point setting (DP) will require the entire unit to be reconfigured to maintain previous control settings.

Profiles, alarm set points, set point limits, etc., DO NOT automatically scale, i.e., 100.0 becomes 1000 (not 100), and must be set up again manually.

** NOTE Cycles register indicates “current cycles remaining” for last jump segment (outer jump) and NOT inner jump segments.

NOTES

**1 Controller memory has a maximum life of one million (1,000,000) write cycles. If the controller is operated by a supervisory control system, avoid excessive set point writes to the controller or premature failure of the controller may result. Units with version number V.19 and later have been updated to write the set point (when sent via communications) to memory once every 6 minutes allowing unlimited set point writes to the controller for a life span of greater than 10 years.

**2 Once the unit has been configured under a specific decimal point selection, changing the decimal point setting (DP) will require the entire unit to be reconfigured to maintain previous control settings. Profiles, alarm set points, set point limits, etc., DO NOT automatically scale, i.e., 100.0 becomes 1000 (not 100), and must be set up again manually.

**3 Read only unless in manual control mode.
Chapter 2 Installation

⚠ Dangerous voltages capable of causing serious injury or death may be present in this instrument. Before installation or prior to beginning any cleaning or troubleshooting procedures, turn off power to all equipment and follow proper lockout-tagout procedures. Units suspected of being faulty should be disconnected and removed to a properly equipped workshop for testing and repair. Component replacement and internal adjustments must be made by a qualified maintenance person only.

⚠ This instrument is protected throughout by double insulation. To minimize the possibility of fire or shock hazards, do not expose this instrument to rain or excessive moisture. □ CAT. II

⚠ Do not use this instrument in areas under hazardous conditions such as excessive shock, vibration, dirt, moisture, corrosive gases or oil. The ambient temperature of the areas should not exceed the maximum rating as specified in Chapter 6.

⚠ The front panel of the instrument may be cleaned using a soft, cloth and a mild detergent. Do not use harsh chemicals or volatile solvents like paint thinners to clean the instrument or discoloration and deformation of the unit case may result.

2-1 Unpacking

Upon receipt, remove the unit from the carton and inspect the unit for shipping damage. If any damage due to transit, report and claim with the carrier. Write down the model number, serial number, and date code for future reference when corresponding with our service center. The serial number (S/N) and date code (D/C) are located on the box label and the housing of the controller.

2-2 Mounting

Make the appropriate panel cutout to the dimensions shown in Figure 2.1. Remove both mounting clamps from the unit and insert the controller into the panel cutout. Snap the mounting clamps back in place and slide them towards the front of the unit until the controller is secured in the cutout.

UMP4191A
2 - 3 Wiring Precautions

* Before wiring, check the label for the correct model number, voltage rating and options.

* Care must be taken to ensure that the maximum voltage rating specified on the label is not exceeded.

* It is recommended that power wiring of the unit be protected by fuses or circuit breakers rated at the minimum value possible.

* The unit should be installed inside a suitably grounded metal enclosure to prevent live parts from being accessed by human hands or metal tools.

* All wiring must conform to appropriate standards of good practice and local codes and regulations. Wiring must be suitable for voltage, current, and temperature rating of the system.

* Do not over-tighten the terminal screws. The torque should not exceed 1 N-m (8.9 Lb-in or 10.2KgF-cm).

* Unused control terminals should not be used as jumper points for other wiring as they may be internally connected, causing damage to the unit.

* Verify that the ratings of the input and output devices connected to the controller do not exceed those specified in Chapter 6.

* Except for thermocouple wiring, all wiring should use stranded copper conductors with a maximum of 18 AWG.

2-4 Power Wiring

2-5 Sensor Input Wiring

Proper sensor type selection and installation are very important factors to obtain precise measurements. Many problems in a control system can be attributed to improper sensor selection or poor installation. The sensor must have the correct range to meet the process requirements. The sensor should also be placed so that it can detect any process changes with minimal lag so that the controller can respond quickly.

For thermocouple inputs, the correct type of thermocouple extension wire must be used for the entire distance between the controller and the thermocouple, ensuring that the correct polarity is observed throughout. Splices in the cable should be avoided if possible. If the length of the thermocouple plus the extension wire is too long, it may affect the temperature measurement. A 400 ohm K type or a 500 ohm J type thermocouple lead resistance will produce 1 degree C error.

For two-wire RTD inputs, terminals 19 and 20 on the P41, or terminals 5 and 6 on the P91 must be connected together. Three-wire RTD’s offer inherent lead resistance compensation provided that the three leads are of same gauge and equal length. Two-wire RTD’s should be avoided if possible, for the purpose of accuracy. A 0.4 ohm lead resistance of a two-wire RTD will produce 1 degree C error.

Figure 2.19 RS-485 Wiring
NOTE: If you use a conventional 9-pin RS-232 cable instead of CC94-1, the cable must be modified according to the following circuit diagram.

Figure 2.21 Configuration of RS-232 Cable
Chapter 3 Configuration

The parameters stored in Home page can be obtained by pressing the scroll key \( \Rightarrow \). The parameters in the Configuration page are obtained by pressing the page key \( \Leftrightarrow \) 2 times to show \( Pr oF \) - the Profile page, then press and hold the page key for 5 seconds to enter the Configuration page.

3-1 Password

There are two parameters which specify the data security function, these are PASS (password) and CODE (security code).

<table>
<thead>
<tr>
<th>Value of CODE</th>
<th>Value of PASS</th>

<td>≠CODE</td>
<td>All parameters are not changeable</td>
</tr>
</tbody>
</table>

Table 3.1 Password operation

3-2 Signal Input

**INPT:** Selects the sensor type or signal type for signal input.
- Range: (thermocouple) J_TC, K_TC, T_TC, E_TC, B_TC, R_TC, S_TC, N_TC, L_TC, C_TC, P_TC.
- (RTD) PT.DN, PT.JS
- (linear) 4-20, 0-20, 0-60, 0-1V, 0-5V, 1-5V, 0-10

**UNIT:** Selects the process unit
- Range: C, F, PU (process unit). If the unit is neither C nor F, then select PU.

**DP:** Selects the resolution of process value.
- Range: (for T/C and RTD) NO.DP, 1-DP
  - (for linear) NO.DP, 1-DP, 2-DP, 3-DP

**INLO:** Selects the low scale value for the linear type input.

**INHI:** Selects the high scale value for the linear type input.
How to use INLO and INHI:
If 4 - 20 mA is selected for INPT, let SL specifies the input signal low (i.e. 4 mA), SH specifies the input signal high (i.e. 20 mA), S specifies the current input signal value, the conversion curve of the process value is then as follows:

![Conversion Curve for Linear Type Process Value](image)

Figure 3.1

Formula: \[ PV = INLO + \frac{(INHI - INLO) \times S}{SH - SL} \]

Example: A 4-20 mA current loop pressure transducer with range 0 - 15 kg/cm² is connected to input, then perform the following setup:

- INPT = 4 - 20
- INLO = 0.00
- INHI = 15.00
- DP = 2-DP

Other decimal point selections may be used to vary the resolution of the input. Two decimal points were merely used for this example.

### 3-3 Event Input

The Event input accepts a (1) relay or switch contact, (2) open collector or (3) TTL logic level input to activate the event input. One of 8 functions can be chosen by using the (E, Fn) setting in the Configuration page.

<table>
<thead>
<tr>

Table 3.2 Heat-Cool Control Configuration Value

Heat Only ON-OFF Control: Select HnF for OUT1 and use O1HY to adjust the dead band for ON-OFF control. The heat only on-off control function is shown in the following diagram.

NOTE: The ON-OFF control mode may introduce excessive process oscillation even if the hysteresis is minimized to the smallest possible value. When ON-OFF control is selected, PB1, TI1, TD1, PB2, TI2, TD2, CYC1, CYC2, OFST, CPB and DB will be hidden and have no function in the control. The auto-tuning mode and bumpless transfer are also disabled.
Heat only P (or PD) control: Select $H_{LP}$ or $H_{LP}$, $n$ for OUT1 and set $T_{I1}$ and $T_{I2}$ to ZERO. OFST is then used to adjust the control offset (manual reset) and O1HY is hidden. OFST is measured in % with a range of 0-100.0%. Under steady state operation (i.e. the process has stabilized), if the process value is lower than the set point by 5°C for example, and 20°C is used for the proportional band, that equals an offset of 25%. Thus, increase the OFST value by 25% and it will compensate for set point offset in the process. After adjusting OFST to a new value, the process value will move to coincide with set point. The auto-tuning mode is disabled for P or PD control. Refer to section 3-11 for manual tuning. P or PD control is not precise for processes with changing load conditions and will require frequent adjustments to the OFST. The PID control mode should thus be used because it automatically does this for you.
Heat only PID control: Set \( HE \) or \( HL \), \( n \) for OUT1 and non-zero values for the proportional band and integral time. Perform an auto tune to obtain the proper tuning parameter values or set appropriate values for PB1, TI1 and TD1. If the control result is still unsatisfactory, it may be necessary to perform manual tuning to improve the control. See section 3-11 for manual tuning. The unit contains an intelligent PID and fuzzy control algorithm to achieve a very small overshoot and very quick response to the process if tuned properly.

Cool only control: ON-OFF control, P (or PD) control and PID control can be selected for cool only control through output 1. Set OUT1 to \( OnF \), \( LePc \) or \( Lb \), \( n \). The operation of cool only ON-OFF control, cool only P (or PD) control and cool only PID control are same as the descriptions for heat only control except that the output variable (and action) for cooling control is the opposite of heating control.

Heat - Cool control: Three types of bimodal (heat/cool) control modes are available as shown in Table 3.1. Case 1 through Case 3 in Figure 3.3 below, depict the various combinations for heat/cool PID operation. Case 4 shows depicts an alternate control mode in which heating is done using proportional control (PID) and cooling is provided through ON-OFF operation.

![Diagram of output power and process value](image-url)
Figure 3.3 Heat - cool Control
**DB Configuration:** Adjustment of DB is more dependent upon system requirements. If more positive values of DB (greater dead band) are used, an unwanted cooling action can be avoided but an excessive overshoot will occur. If more negative values of DB (greater overlap) are used, an excessive overshoot can be minimized but an unwanted cooling action may occur. DB is adjustable in the range of -36.0% to 36.0 % of PB. A negative DB value provides an overlap between heating and cooling in which both outputs are active. A positive DB value provides a dead band area in which neither output is active around set point.

**NOTE:** For bimodal (heat/cool) operation, ON-OFF control may result in excessive overshoot and undershoot problems in the process. The P (or PID) control will result in the process value constantly deviating from set point. It is recommended to use PID control for the heat/cool operation to produce a stable and zero offset process value.

**NOTE :** The adjustment of CPB is also related to the cooling media used. When air is used as the cooling media, it is recommended that CPB be set to 100%. For oil, a typical setting to use for CPB is 125%. If water is used as the cooling media, adjust CPB to 250%.

**CPB Configuration:** The cooling proportional band is measured in % of the proportional band (PB) with a range 50-300. Set CPB to 100% to begin and examine the cooling effect. If cooling action should be enhanced then decrease CPB. If cooling action is too strong then increase CPB. The value of CPB is related to PB and its value remains unchanged throughout any auto-tuning procedures.

**DB Configuration:** Adjustment of DB is more dependent upon system requirements. If more positive values of DB (greater dead band) are used, an unwanted cooling action can be avoided but an excessive overshoot will occur. If more negative values of DB (greater overlap) are used, an excessive overshoot can be minimized but an unwanted cooling action may occur. DB is adjustable in the range of -36.0% to 36.0 % of PB. A negative DB value provides an overlap between heating and cooling in which both outputs are active. A positive DB value provides a dead band area in which neither output is active around set point.

**NOTE :** For bimodal (heat/cool) operation, ON-OFF control may result in excessive overshoot and undershoot problems in the process. The P (or PID) control will result in the process value constantly deviating from set point. It is recommended to use PID control for the heat/cool operation to produce a stable and zero offset process value.

**CYC1, CYC2, O1FT and O2FT Configuration:** The output cycle times, CYC1 and CYC2 should be adjusted according to the type of output device. Generally, a 0.5~2 sec. can be used if a solid state relay drive or solid relay (triac) is installed for the output. If a relay is installed for the output, a 10~20 sec. cycle time is used. If a linear output (voltage or current) is used, the cycle time can be ignored.

See **Section 3-9** for O1FT and O2FT adjustment.
3-5 Alarms

The unit can be configured with up to three alarm outputs on the P41 at OUT2, OUT3 and OUT4 and up to two alarm outputs on the P91 at OUT2 and OUT3. There are 8 alarm functions and 4 alarm modes available for each alarm output.

**P_H** : A process high alarm is independent of set point. When the process is higher than the alarm set point, a process high alarm occurs. When the process value is lower than the alarm set point minus the alarm hysteresis, the alarm is off.

![Process High Alarm 1 Operation](image)

**P_L** : A process low alarm is independent of set point. When the process is lower than the alarm set point, a process low alarm occurs. When the process value is above the alarm set point plus the alarm hysteresis, the alarm is off.

![Process Low Alarm 1 Operation](image)
**dEH**: A deviation high alarm is dependant upon the control set point and alerts the operator when the process deviates too high over the set point value. When the process is higher than \( SV + ASP1 \) (NOTE: \( ASP1 \) must be entered as a positive value), a deviation high alarm occurs. When the process falls below \( SV + ASP1 - A1HY \), the alarm is off.

*Figure 3.6 Deviation High Alarm 1 Operation*

![Deviation High Alarm 1 Operation Diagram](image)

**dELa**: A deviation low alarm is dependant upon the control set point and alerts the operator when the process deviates too low below the set point value. When the process is lower than \( SV + ASP1 \) (NOTE: \( ASP1 \) must be entered as a negative value), a deviation low alarm occurs. When the process is higher than \( SV + ASP1 + A1HY \), the alarm is off.

*Figure 3.7 Deviation Low Alarm 1 Operation*

![Deviation Low Alarm 1 Operation Diagram](image)
A deviation band high/low alarm presets two trigger levels relative to the control set point value. The two trigger levels are SV+ASP1 and SV-ASP1 for the high and low alarm values. When the process is higher than SV+ASP1 or lower than SV-ASP1, a deviation band alarm occurs. When the process is within the trigger levels, SV+ASP1-A1HY and SV-ASP1+A1HY, the deviation band alarm is off.

NOTE: ASP1 must be entered as a positive value.

**Figure 3.8 Deviation Band Alarm 1 Operation**

**NOTE:** The settings and operation of alarm 2 and alarm 3 are the same as those described for alarm 1. In the above descriptions, SV denotes the current set point value for control which is different from SP1 when in the profile mode of operation.
The alarm modes (A1MD, A2MD and A3MD) are set by using a three bit binary number.

<table>
<thead>
<tr>
<th>alarm mode value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>norm</em></td>
<td>A direct acting normal alarm output is off as the non-alarm condition and on as an alarm condition. The output state is inverted as a reverse alarm output is selected for OUT2, OUT3 or OUT4.</td>
</tr>
<tr>
<td><em>Latch</em></td>
<td>A direct acting latching alarm output is on as an alarm condition and it will remain unchanged even if the alarm condition is cleared. The output state is inverted as a reverse alarm output is selected for OUT2, OUT3 or OUT4.</td>
</tr>
<tr>
<td><em>Hold</em></td>
<td>A direct acting holding alarm output is off even if an alarm condition may occur on power up. This will prevail until the alarm condition returns to the &quot;inactive&quot; condition, thereafter the alarm will operate normally. The output state is inverted as a reverse alarm output is selected for OUT2, OUT3 or OUT4.</td>
</tr>
<tr>
<td><em>Latch.Hold</em></td>
<td>A direct acting latching and holding alarm performs both holding and latching alarm functions. The output state is inverted as a reverse alarm output is selected for OUT2, OUT3 or OUT4.</td>
</tr>
</tbody>
</table>

**Table 3.3 Alarm mode description**

The latching alarm output is reset when both ▲ and ▼ keys are pressed at the same time and the alarm condition is no longer present.
3-6 Configure Home Page

Conventional controllers are designed with fixed parameter scrolling. The “P” Series has the flexibility for you to select the parameters which are most useful to you and put these parameters in the home page. Hence, you can have a custom home page.

There are up to eight parameters can be displayed on the home page. These are the SEL1~SEL8 parameters in the configuration page. Each parameter can be configured to display one of 19 parameters: INPT, UNIT, DP, PB1, T11, T1D, PB2, T12, T2D, OFST, O1HY, CYC1, CYC2, CPB, DB, A1HY, A2HY, A3HY and ADDR. Note that not all of the 19 parameters may be available as some of the selections or only visible based on the configuration of the controller.

3-7 User Calibration

Each unit is calibrated at the factory before shipment; however, the unit can be re-calibrated in the field with the use of proper calibration equipment.

**Purpose of User Calibration**

The basic calibration of the unit is highly stable and set for life. User calibration allows you to offset the permanent factory calibration to either:

1. Calibrate the unit to meet your reference standard.
2. Match the calibration of the unit to that of a particular transducer or sensor input.
3. Calibrate the unit to suit the characteristics of a particular installation.
4. Remove long term drift in the factory set calibration.

There are two parameters: offset low value (OFSTL) and offset high value (OFSTH) which can be adjusted to correct the error in the process value reading. See Section 1-5 for the key operation flowchart; press the key until the low calibration page is obtained.
Send the low signal to the input of unit, then press the \( \text{②} \) key. If the process value (the upper display) is different from the input signal, you can then use the \( \text{①} \) and \( \text{③} \) keys to change the OFSTL value (the lower display) until the process value is equal to the correct value you input to the unit. Then press and hold \( \text{②} \) key for 5 seconds. The low point calibration is complete. The same steps can then be used to adjust the high point calibration.

Figure 3.9 Two Point User Calibration

The two point offset constructs a straight line (linear calibration) between the two points. To insure greatest accuracy, it is best to calibrate with the two points at the minimum and maximum operating ranges of the system. After user calibration is complete, the input type will be stored in the memory. If the input type is changed, a calibration error will occur and an error code (\( \text{E} \text{R} \text{E} \text{r} \) ) is displayed.
3-8 Digital Filter

In certain application the process value is too unstable to be read. To improve this, a programmable low pass filter incorporated in the controller can be used. This is a first order filter with a time constant specified by the FILT parameter. The default value of FILT is 0.5 sec. FILT can be adjusted to a time constant from 0 to 60 seconds. Zero seconds represents no filtering is applied to the input signal. The filter is characterized by the following diagram.

![Figure 3.10 Filter Characteristics](image)

**Note**

The Filter is available only for PV, and is performed for the displayed value only. The controller is designed to use the unfiltered signal for control even if a filter is applied. A lagged (filtered) signal, if used for control, can produce unstable process control.
3 -9 Failure Transfer

The controller will enter failure mode if one of the following conditions occurs:

1. **SBER** occurs due to the input sensor break or input current below 1mA if 4-20 mA is selected or input voltage below 0.25V if 1-5 V is selected.
2. **ADER** occurs due to the A-D converter of the controller fails.

Output 1 and output 2 will perform the failure transfer function as the controller enters failure mode.

Output 1 Failure Transfer, if activated, will perform:

1. If output 1 is configured as proportional control (i.e., HTPC, CTPC, HLIN, or CLIN selected for OUT1), and BPLS is selected for O1FT, then output 1 will perform bumpless transfer. Thereafter the previous averaging value of MV1 will be used for output 1.
2. If output 1 is configured as proportional control, and a value of 0 to 100.0% is set for O1FT, then output 1 will perform failure transfer. Thereafter the value of O1FT will be used for controlling output 1.
3. If output 1 is configured as ON-OFF control (i.e., HONF or CONF is selected for OUT1), then output 1 will transfer to off state if OFF is set for O1FT and transfer to on state if ON is set for O1FT.

Output 2 Failure Transfer, if activated, will perform:

1. If output 2 is configured as CTPC or CLIN, and BPLS is selected for O2FT, then output 2 will perform bumpless transfer. Thereafter the previous averaging value of MV2 will be used for output 2.
2. If output 2 is configured as CTPC or CLIN, and a value of 0 to 100.0% is set for O2FT, then output 2 will perform failure transfer. Thereafter the value of O2FT will be used for controlling output 2.
3. If OUT2 is configured as alarm function, and OFF is set for O2FT, then output 2 will transfer to off state, otherwise, output 2 will transfer to on state if ON is set for O2FT.

OUT3 and OUT4 Failure Transfer is activated as the controller enters failure mode. Thereafter the alarm will transfer to the ON or OFF state which is determined by the set value of O3FT or O4FT.
3 -10 Auto-tuning

⚠️ The auto-tuning process is performed at set point. The process will oscillate around the set point during tuning process. Set the set point to a lower value if overshooting beyond the normal process value is likely to cause damage to the system.

Auto-tuning is applied in cases of:
* Initial setup for a new process.
* The process has changed substantially from the previous auto-tuning values.
* The control result is unsatisfactory.

Operation:
1. Set the correct values on the configuration page. Nonzero values for PB and TI should be set.
2. Set EIFN = PID2 if a second set of PID’s is required to be tuned.
3. Set the set point to a normal operating value or a lower value if overshooting beyond the normal process value is likely to cause damage and then enter the A-T mode. The upper display will begin to flash and the auto-tuning procedure for PID1 will begin.
4. If the system needs to use a second set of PID values, then after the first auto-tuning is complete, close the event input of the unit and repeat step 3 for the second set of PID values.

NOTE :
The auto-tuning mode is disabled as soon as either failure mode or manual control mode occurs.

Procedures:
The auto-tuning can be applied either as the process is warming up (Cold Start) or once the process has been operating at steady state (Warm Start) conditions.

After the auto-tuning procedures are completed, the upper display will cease to flash and the unit revert to PID control using its new PID values. The PID values obtained are stored in the nonvolatile memory.
Auto-Tuning Error

If auto-tuning fails an ATER message will appear on the upper display in cases of:

- If PB exceeds 9000 (9000 PU, 900.0 F or 500.0 C).
- or if TI exceeds 3600 seconds.
- or if set point is changed during auto-tuning procedure.

Solutions to ATER

1. Try auto-tuning once again.
2. Don't change set point value during auto-tuning procedure.
3. Don't set zero value for PB and TI.
4. Use manual tuning instead of auto-tuning (See section 3-12).
5. Touch ▲ and ▼ key to reset ATER message.

3 - 11 Manual Tuning

In certain applications (very few) using auto-tune to tune a process may be inadequate for the control requirements. If this is the case, then you can try manual tuning.

If the control performance by using auto-tuning is unsatisfactory, use the following rules for further adjustment (manual tuning) of PID values:

<table>
<thead>
<tr>
<th>ADJUSTMENT SEQUENCE</th>
<th>SYMPTOM</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Proportional Band ( PB )</td>
<td>Slow Response</td>
<td>Decrease PB</td>
</tr>
<tr>
<td></td>
<td>High overshoot or Oscillations</td>
<td>Increase PB</td>
</tr>
<tr>
<td>(2) Integral Time ( TI )</td>
<td>Slow Response</td>
<td>Decrease TI</td>
</tr>
<tr>
<td></td>
<td>Instability or Oscillations</td>
<td>Increase TI</td>
</tr>
<tr>
<td>(3) Derivative Time ( TD )</td>
<td>Slow Response or Oscillations</td>
<td>Decrease TD</td>
</tr>
<tr>
<td></td>
<td>High Overshoot</td>
<td>Increase TD</td>
</tr>
</tbody>
</table>

- **Perfect**

Figure 3.11 Effects of PID Adjustment
3 - 12 Manual Mode

Operation:
To enable manual control, the password PASS should be set with a value equal to CODE (except CODE=0).

Press key to get  (mode select), then use ▲ and ▼ keys to obtain  (Man ). Then press key for 5 seconds and the unit will enter manual mode. The upper display will begin to flash and the lower display will show or . indicates control percentage value for heating output and indicates control percentage value for cooling output. The up and down keys can be used to adjust the percentage values for the heating or cooling output. The controller performs open loop control as long as it stays in manual mode.

Exit Manual Mode
To press both ▲ and ▼ keys, the controller will revert to static mode and show home display.

3 - 13 Data Communication
The controllers support the RTU mode of Modbus protocol for data communications. Other protocols are not available for the series.

Two types of interfaces are available for serial communications. These are RS-485 and RS-232 interfaces. Since RS-485 uses a differential architecture to drive and sense signal instead of a single ended architecture which is used for RS-232, RS-485 is less sensitive to noise and suitable for a longer distance. RS-485 can communicate without error over distances of up to 1 km while RS-232 is not recommended for distances over 20 meters.

Since a standard PC does not provide an RS-485 port, a network adaptor (such as the SNA10A) has to be used to convert the RS-485 signal to RS-232 for the PC’s serial port. Using RS-485 allows multiple units (up to 247) to be connected a single port while RS-232 allows only a single device to be connected.
Data Communications Setup

Enter the configuration page and select COMM for OUT4 (P41 only) or OUT5. Set the desired address (ADDR) for the unit, and set the baud rate (BAUD) and parity (PARI) to match the values used for the PC’s port. When using RS-485, each unit on the link must have its own unique address. If more than one unit is set to the same address, the communications will not work properly.

**NOTE:** If you use a conventional 9-pin RS-232 cable instead of the CC94-1, the cable should be modified for proper operation according to Section 2-10.

3 - 14 Retransmission

The unit can output (retransmit) the process value or set point value via its retransmission terminals RE+ and RE- provided that the retransmission option is ordered. To enable retransmission, select \( rE.PU \) for the PV or \( rE.SP \) for the SP in the configuration page for OUT4 (P41 only) or OUT5. The following parameters will then have to be configured for the selected output:

- **OP4L:** Low limit value for output 4
- **OP4H:** High limit value for output 4
- **REL4:** Retransmission low scale value for output 4
- **REH4:** Retransmission high scale value for output 4
- **OP5L:** Low limit value for output 5
- **OP5H:** High limit value for output 5
- **REL5:** Retransmission low scale value for output 5
- **REH5:** Retransmission high scale value for output 5

**Example:** If you want to output 4mA for PV at 0°C and 20mA for PV at 1000°C via output 5, then set the following parameters:

\[
\text{OUT5 } = \ rE.PU \\
\text{OP5L } = 20.0(\%)\text{, since 20\% of a 0-20mA output module will output 4mA (20\% of 20mA span).} \\
\text{OP5H } = 100.0(\%) \\
\text{REL5 } = 0^\circ\text{C} \\
\text{REH5 } = 1000^\circ\text{C}
\]
3 - 15 Output Scaling

Output scaling can be applied to the control outputs when a linear output is used (Case 1 in Fig. 3.12) and to the retransmission output (Case 2 in Fig. 3.12). The Out.L value in Fig. 3.12 may be 0 mA, 0V, 1V or 4mA, and the Out.H value may be 20mA, 5V or 10V according to the output module installed.

**Case 1**

![Case 1 Diagram]

**Case 2**

![Case 2 Diagram]

**Figure 3.12 Output Scaling Function**
Chapter 4 Profiler Operation

4-1 What Is a Set Point Profiler

Many applications need to vary temperature or process value with time. Such applications need a controller which varies set point as a function of time. The P41 and P91 controllers can do this. The set point is varied by using a set point profiler. Profiles are stored as a series of "ramp" and "dwell" segments, as shown below.

![Figure 4.1 Set Point Profile](image)

In each segment, you can also define the state of up to 3 event outputs which can drive either relay, logic or triac outputs depending on the modules installed in the controller.

A profile can be executed once, or repeated a set number of times or even repeated continuously. If repeated a set number of times, the number of cycles must be specified as part of the profile.

There are four types of segment:

<table>
<thead>
<tr>
<th>Ramp</th>
<th>The set point ramp (linear), from its current value to a new value, can be at a set rate (ramp rate), or in a set period of time (ramp time). The ramp rate or the ramp time and the target set point are specified for each segment when creating or modifying a profile.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dwell</td>
<td>The set point remains constant for a specified period.</td>
</tr>
<tr>
<td>Jump</td>
<td>It is often necessary to jump backward and run the loop a set number of cycles.</td>
</tr>
<tr>
<td>End</td>
<td>The profile either ends in this segment or repeats a set number of cycles. The profile stops after the repeated cycles are finished.</td>
</tr>
</tbody>
</table>

**Table 4.1 Segment Types**
4-2 Segment Connection

Four kinds of combinations are allowable for connecting segments. These are:

- **Ramp-Ramp:**
- **Ramp-Dwell:**
- **Dwell-Ramp:**
- **Dwell-Dwell:**

4-3 Profiler (Control) Modes

The “P” Series controllers have eight operating modes:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run</td>
<td>In run mode, the profiler varies the set point according to the stored profile values.</td>
<td>RUN light on</td>
</tr>
<tr>
<td>Hold</td>
<td>In hold mode, the profile is “frozen” at its current point. In this state you can make temporary changes to any profile parameter (for example, a target set point, a dwell time or the time remaining in the current segment). Such changes will only remain effective until the profile is reset and run again, when they will be overwritten by the stored profile values.</td>
<td>HLD light on</td>
</tr>
<tr>
<td>Mode</td>
<td>Description</td>
<td>Indication</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>Holdback</td>
<td>Holdback indicates that the process value is lagging the set point by more than a preset amount (holdback band, HBBD) and that the profile is in HOLD, waiting for the process to catch up.</td>
<td>HLD light flashes.</td>
</tr>
<tr>
<td>Static</td>
<td>In static mode, the profiler is inactive and the controller acts as a standard controller, with the set point determined by the value set in the lower display.</td>
<td>Both RUN and HLD light are off.</td>
</tr>
<tr>
<td>A-T</td>
<td>In automatic tuning mode, the profiler is inactive and the controller executes the automatic tuning function at its static mode set point.</td>
<td>Both RUN and HLD light are off. Upper display flashes.</td>
</tr>
<tr>
<td>MAN</td>
<td>In manual mode, the profiler is inactive and the heating and cooling output values can be adjusted at the lower display by the up-down keys.</td>
<td>Both RUN and HLD light are off. Upper display flashes. Lower display shows H_ _ _ _ or C_ _ _ _ .</td>
</tr>
<tr>
<td>OFF</td>
<td>In off mode, the profiler is inactive and all the outputs are disabled. This includes all the control outputs as well as all alarm and event outputs.</td>
<td>Both RUN and HLD light are off. Upper display shows OFF and flashes.</td>
</tr>
<tr>
<td>End</td>
<td>The profile is complete.</td>
<td>Both RUN and HLD lights flash.</td>
</tr>
</tbody>
</table>

**Table 4.2 Profiler Modes**

**4-4 Running, Holding and Aborting a Profile**

To change the operating mode of the controller, press the page key until the mode page is obtained. The upper display will show \( \text{node} \) and the lower display indicates the mode selection value. To start a profile, press the up/down keys repeatedly until \( \text{run} \) is obtained, then press and hold the page key for 5 seconds to switch the profiler into RUN mode.
Once a profile is running, the user can put the profiler in HOLD mode, which "freezes" the profile at its current state. The set point, event outputs and time remaining in the segment will maintain their values unless changed by the user or the profiler is put back into RUN mode. To place the profiler in HOLD, select **Hold** from the mode page, and press and hold the page key for 5 seconds. The profiler will then enter HOLD mode.

The operator may also abort (i.e., terminate) the profile by selecting **Start** (static mode) from the mode page. When the program is aborted, the profiler is inactive and enters static mode. At the same time both the RUN light and HLD light are off.

### 4-5 Viewing and Modifying Profile Operation

Three parameters: PFSG, TIME and CYCL indicate the status of profile progress. The operator can easily view these parameters, the current profile and segment number, the time remaining for the current segment and the cycles remaining for the current profile, on the home page by pressing the scroll key and cycling through the values.

By changing the value of _P_—_—_ (profile and segment number) using the up/down keys, the user can select a desired profile/segment entry point to start or jump the current segment to the next segment when in HOLD mode. When in HOLD mode, the user can also change the value of TIME to shorten or prolong the time remaining of the current segment. If it is determined that additional cycles are required of the current profile, the CYCL parameter can be changed to increase or decrease the number of jumps remaining.

### 4-6 Profile Start Options

When a profile is started, the set point can start from either the current process value, the last control set point or from a predefined starting set point. The **STAR** parameter is used to specify this starting set point value.

- **PV:** selects the process value (default value)
- **SP1:** selects the current controller set point value
- **STSP:** selects the start set point value

The normal method is to start from the process value, because this will produce a smooth and bumpless start to the process. However, if the time period of the first segment must be defined, using SP1 or STSP for the starting point will insure that the first segment time duration is maintained.
4-7 Holdback

As the set point ramps up or down (or dwells), the measured value may lag behind or deviate from the set point by an undesirable amount. "Holdback" is available to freeze the profile at its current state, should this occur. The action of Holdback is similar to a deviation alarm and can be enabled or disabled on a per segment basis. Holdback uses three parameters: HBT - holdback wait time, HBBD - holdback band and HBTY - holdback type.

If the deviation from the set point exceeds the holdback band (HBBD), then the holdback feature, if enabled, will automatically freeze the profile at its current point and the HLD light will flash to indicate holdback is active. At the same time, the holdback timer begins to count. When the value of the holdback timer exceeds the value of holdback wait time HBT, the profiler will automatically terminate the holdback and jump to the next segment. When this occurs, an error code $HbE-$ will be displayed on the controller to indicate that the holdback wait time had been exceeded.

If the process value returns to within the holdback band setting before the holdback timer is exceeded, the profile will resume operation as normal. There are four different Holdback types:

- OFF - Disables Holdback - no action is taken.
- Lo - Deviation Low Holdback holds the profile back when the process value deviates below the set point by more than the holdback band (HBBD).
- Hi - Deviation High Holdback holds the profile back when the process value deviates above the set point by more than the holdback band (HBBD).
- Band - Deviation Band Holdback is a combination of the two. It holds the profile back when the process value deviates either above or below the set point by more than the holdback band (HBBD).

NOTE:

HBT is a global parameter which is common to all profiles.
HBBD is a parameter which applies to a specific profile.
HBTY is a parameter which applies to a segment in a specific profile.
Holdback on Dwell

Profile held if HBTY set to Hi or BAND

Profile held if HBTY set to Lo or BAND

Holdback on Positive Ramp

Profile held if HBTY set to Hi or BAND

Profile held if HBTY set to Lo or BAND

Holdback on Negative Ramp

Profile held if HBTY set to Hi or BAND

Profile held if HBTY set to Lo or BAND

Figure 4.2 Holdback Operation
4-8 Power Failure

If power is lost to the controller and then restored while a profile is running, the behavior of the profile is determined by the setting of the power failure recovery parameter "PFR" in the profile configuration. There are 4 available settings - \textit{cont}, PV, SP and off.

If \textit{cont} is selected, then when power is restored, the profile continues from where it was interrupted when power was lost. The set point value (SV), time remaining (TIME) and cycles remaining (CYCL) will be restored to their power-down values. This selection provides the fastest process recovery. The following figures (4.3 and 4.4) show the recovery action when continue is selected.

\begin{figure}[h]
\centering
\includegraphics[width=0.8\textwidth]{figure4.3}
\caption{Recovery from Profile at Dwell Segment}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=0.8\textwidth]{figure4.4}
\caption{Recovery from Profile at Ramp Segment}
\end{figure}
If $PV$ is selected, then when power is restored the set point starts at the current process value, and then ramps to the target set point of the active segment within the remaining segment time. This choice provides a smoother recovery. The two figures below illustrate the respective recovery responses.

**Figure 4.5 Recovery from PV at Dwell Segment**

**Figure 4.6 Recovery from PV at Ramp Segment**

If $SP$ is selected, when power is restored, the profiler is disabled and the controller enters static mode. $SP1$ is used for the control set point.

If $OFF$ is selected, when power is restored, the profiler is disabled and the controller enters OFF mode. All the control outputs as well as alarm and event outputs are turned off.
4-9 Configuring the Profiler

Prior to creating a profile or using the controller for the first time, you should familiarize yourself with all of the profile parameters and settings, and insure that the controller is configured properly for your application.

The following parameters are common to all profiles (configuration):

**Global Data**
- STAR: set point value at start of profile
- END: set point value at end of profile
- DLAY: delay time before profile start
- PFR: power fail recovery
- HBT: holdback wait time

The following parameters apply to a specific profile:

**Profile Data**
- PROF: profile number selected for view
- HBBD: holdback band
- STSP: start set point value
- RMPU: unit for ramp segment
- DLLU: unit for dwell segment

The following parameters apply to each segment of a specific profile:

**Segment Data**
- SGNO: segment number
- SGTY: segment type
- TGSP: target set point
- RTRR: ramp time or ramp rate
- P2EV: PID selection and event output states
- HBTY: holdback type
- DLLT: dwell time
- SEG: target segment number for jump segment
- CYCL: repeat number of cycle
- FSP: final set point for the end segment

4-10 Viewing and Creating a Profile

To create or view a profile stored in the unit, press the page key repeatedly in order to get to the profile page. The profile page will be indicated by \( PrOF \) in the upper display, and the lower display will indicate the number of the currently selected profile (1-9).
Using the up/down keys, enter the number of the profile to be viewed or edited. Once the selection is made, pressing the scroll key will then cycle through the profile data and segment parameter values (see Section 1-5, Key Operation Flowchart).

The profile data values include the holdback band \((Hb\ b\ d)\), the start set point \((St\ SP)\), the ramp units \((RN\ PU)\) and the dwell units \((DL\ Lu)\). If holdback is going to be required for the profile, set the holdback band to the allowed maximum deviation that will be allowed from set point during profile operation. Note that the holdback band is entered in whole numbers only, regardless of the decimal point selection made for the input configuration of the control.

If the profile start set point has been selected in the configuration as the start set point for profiles, set the start set point to the required value for the profile. Next, set the ramp and dwell units to the desired setting for the profile. Note that these settings apply to all ramp and dwell segments of the profile. The available selections are:

**Ramp Segments**

- \(HH\ \n\n\) = hours : minutes
- \(\n\n\ n\n\) = minutes : seconds
- \(\n\n\ n\ n\) = ramp rate in units per minute
- \(\n H F\) = ramp rate in units per hour

**Dwell Segments**

- \(HH\ \n\n\) = hours : minutes
- \(\n\n\ n\n\) = minutes : seconds

The next parameter after the profile data values is the segment number \((SGn0)\). This is the first of the segment parameters and is used to select which segment of the profile is to be viewed/edited. The value can be changed using the up/down arrow keys from 0 (first step of the profile) to the last step of the selected profile.

Pressing the scroll key repeatedly will cycle through the available segment parameters. The display will then automatically return to the segment number parameter once all other parameters have been set for a segment, in order to speed profile entry. This allows the user to simply set the next segment number of the profile and then scroll through and edit its associated values.
The first parameter of a segment is the segment type (SGTY). The type of segment defines the other parameters that are visible and required to be set for the segment. The four segment types are:

- **RAMP**: ramp to a new target set point at a set rate or in a set time
- **DWELL**: dwell for a set time
- **JUMP**: jump to a specified segment in the same profile
- **End**: last segment (end of the profile)

Once the segment type is defined, pressing the scroll key will cycle through the remaining parameters for the segment as shown in the following chart.

<table>
<thead>

</tbody>
</table>

*Table 4.3 Parameters Associated with Segment Type*

Note that there can be more than one end step in a profile if not all segments are used. In these cases, the first end step will be used as the last segment of the profile. One the profile entry is complete, pressing both the up and down keys at the same time, or pressing the page key, will return to the home page.
A heat treatment oven needs to vary temperature as a function of time according to the process graph depicted above. Output 1 of the control is used as the heating output, but due to the high rate of heating required, an additional heater is turned on at elevated temperatures using event 1 (output 2) to act as a boost. When the boost heater is activated, a second PID set is also required in order to maintain proper temperature control of the oven.

In order to accelerate cooling, a fan is turned on through event 2 (output 3) during the cooling sequences. In order to alert operators that the profile has completed, an alarm is connected to output 4 (event 3) of the P41 controller. This is turned on for the last segment of the profile to indicate that the process is complete.

The event outputs and PID selection are defined by parameter P2EV. There are up to 3 event outputs that can be configured, which utilize OUT2, OUT3 and OUT4 (P41 only). Register 95, shown in Section 1-6 describes how to define event status and select PID values.

The controller can store two sets of PID parameters in memory. If the unit is in RUN or HOLD mode, the PID sets are selected by the most significant bit of parameter P2EV. If the unit is in static mode (STAT), the PID sets are selected by event input function EIFN. If the unit is in A-T mode, then tuning is performed on PB1, TI1 and TD1. If the unit is in AT2 mode, then PB2, TI2 and TD2 are selected for the tuning parameters.
Chapter 5 Specifications

Power
90-250 Vac, 47-63 Hz, 12VA, 5W maximum
11-26 Vac/Vdc, 12VA, 5W maximum (optional)

Event Input
Logic Low: -10V minimum, 0.8V maximum.
Logic High: 2V minimum, 10V maximum
External pull-down Resistance: 400KΩ maximum
External pull-up Resistance: 1.5MΩ minimum

Control Input
Resolution: 18 bits
Sample Rate: 5Hz
Digital Filter: 0, 0.2, 0.5, 1, 2, 5, 10, 20, 30, 60 second programmable
Maximum Rating: -2 Vdc min., 12 Vdc max. (1 minute for mA input)
Temperature Effect: 1.5μV/°C (3.0μV/°C for mA input)
Sensor Lead Resistance Effect:
  T/C: 0.2μV/ohm
  3-wire RTD: 2.6°C/ohm of resistance difference of two leads
  2-wire RTD: 2.6°C/ohm of resistance sum of two leads
Burn-out Current: 200nA
Common Mode Rejection Ratio (CMRR): 120dB
Normal Mode Rejection Ratio (NMRR): 55dB
Sensor Break Detection:
  Sensor open for TC, RTD and mV inputs
  Sensor short for RTD input
  below 1 mA for 4-20 mA input
  below 0.25V for 1 - 5 V input
  unavailable for other inputs
Sensor Break Response Time:
  Within 4 seconds for TC, RTD and mV inputs
  0.1 seconds for 4-20mA and 1-5V inputs

**Analog Retransmission**

Output Signal: 4-20mA, 0-20mA, 0-5V, 1-5V, 0-10V  
Resolution: 15 bits  
Accuracy: 0.05% of span  
Load Resistance:  
- 0 - 500 ohms (for current output)  
- 10 K ohms minimum (for voltage output)  
Isolation Breakdown Voltage: 1000 VAC min.  
Output Regulation: 0.01% for full load change  
Output Settling Time: 0.1 sec. (stable to 99.9%)  
Integral Linearity Error: 0.005% of span  
Temperature Effect: 0.0025% of span/°C  
Saturation Low: 0mA (or 0V)  
Saturation High: 22.2 mA (or 5.55V, 11.1V min.)  
Linear Output Range:  
- 0-22.2mA (0-20mA or 4-20mA)  
- 0-5.55V (0-5V, 1-5V)  
- 0-11.1V (0-10V)

**Data Communication**

Interface: RS-232 (1 unit), RS-485 (up to 247 units)  
Protocol: Modbus RTU  
Address: 1-247  
Baud Rate: 2.4 ~ 38.4 Kbits/sec  
Parity: None, Even or Odd  
Communication Buffer: 256 bytes

**Profiler**

Number of Profiles: 9  
Number of Segments per Profile:  
- Profile 1 ~ 4: 16  
- Profile 5 ~ 7: 32  
- Profile 8, 9: 64  
Event Outputs: 3 maximum (2 for P91)
User Interface

Dual 4-digit LED Displays
Keypad: 4 keys
Programming Port: automatic setup, calibration and testing
Communication Port: RS-232 or RS-485 (Modbus RTU protocol)

Control Mode

Output 1: Reverse (heating) or direct (cooling) action
Output 2: Event 1 or alarm 1, PID cooling control; cooling P band 50~300% of PB, dead band -36.0 ~ 36.0% of PB
Output 3: Event 2 or alarm 2
Output 4: Event 3 or alarm 3 (P41 only)
ON-OFF: 0.1-90.0 (°F) hysteresis control (P band = 0)
P or PD: 0-100.0% offset adjustment
PID: Fuzzy logic modified
  Proportional band 0.1 ~ 900.0°F.
  Integral time 0-1000 seconds
  Derivative time 0-360.0 seconds
Cycle Time: 0.1-90.0 seconds
Manual Control: Heat (MV1) and Cool (MV2)
Auto-tuning: Cold start and warm start
Failure Mode: Auto-transfer to manual mode for sensor break or A-D converter failure
Ramping Control: 0-900.0 °F/minute or 0-900.0°F/hour ramp rate

Alarm

Alarm Functions: Dwell timer, deviation high/low, deviation band, PV high/low alarm
Alarm Mode: Normal, latching, hold, latching/hold
Dwell Timer: 0.1-4553.6 seconds
Environmental & Physical
Operating Temperature: -10°C to 50°C
Storage Temperature: -40°C to 60°C
Humidity: 0 to 90% RH (non-condensing)
Altitude: 2000m maximum
Pollution: Degree 2
Insulation Resistance: 20 Mohms min. (at 500 VDC)
Dielectric Strength: 2000 VAC, 50/60 Hz for 1 minute
Vibration Resistance: 10 - 55 Hz, 10 m/s² for 2 hours
Shock Resistance: 200 m/s² (20g)
Moldings: Flame retardant polycarbonate
Dimensions:
   P41 ----- 96mm(W) X 96mm(H) X 65mm(D),
            53 mm depth behind panel
   P91 ----- 48mm(W) X 48mm(H) X 116mm(D),
            105 mm depth behind panel

Weight:
   P41 ----- 250 grams
   P91 ----- 150 grams

Approval Standards
UL Listed File E197216
CSA File 209463
CE EN61010-1 (IEC1010-1)
RoHS
EMC En61326

Protective Class:
   IP65 for panel with additional option
   IP50 for panel without additional option
   IP20 for terminals and housing with protective cover.
   All indoor use only.

EMC: En61326

Warranty

Future Design Controls products shown below are warrantied to be free from functional defects in materials and workmanship at the time the products leave Future Design Controls facilities and to conform at that time to the specifications set forth in the relevant Future Design Controls manual, sheet or sheets for a period of Three years after the delivery to the first purchaser for use.

Future Design Controls provides no warranty or representations of any sorts regarding the fitness of use or application of its product by the purchaser. Users are responsible for the selection, suitability of the products for their application or use of Future Design Controls products.

Future Design Controls shall not be liable for any damages or losses, whether direct, indirect, incidental, special, consequential or any other damages, costs or expenses excepting only the cost or expense of repair or replacement of the Future Design Control products as described below.

Future Design Controls sole responsibility under warranty, at Future Design Controls option, is limited to replacement or repair, free of charge, or refund of purchase price within the warranty period specified. This warranty does not apply to damage resulting from transportation, alteration, misuse or abuse.

Future Design Controls reserves the right to make changes without notification to purchaser to materials or processing that do not affect compliance with any applicable specifications.

RETURN MATERIAL AUTHORIZATION:

Please contact Future Design Controls for Return Material Authorization Number prior to returning to factory.
